## What is Emerald Ash Borer - EAB ?

Emerald Ash Borer is a serious new pest of Ash trees in the Midwest.  
It will severely injure and kill all Ash species.

### What are the symptoms of Emerald Ash Borer?

- \* Dieback of leaves beginning in the upper 1/3rd of the canopy and progressing downward over time.
- \* Vertical splits in the trees bark.
- \* D - shaped exit holes in the bark.
- \* S - shaped channels under the bark
- \* Numerous water sprouts from the lower trunk.

Adult Borer and D shaped exit hole

### How do you control Emerald Ash Borer?

**Chemical treatment:** All Ash should be protected with an annual treatment of soil injected insecticide. The active ingredient is Imidacloprid. We add an 18-3-6 tree formulated liquid fertilizer with micro-nutrients to be sure the tree stays in good health. An Ash with Borer should be treated with a trunk injection for quick control and then with annual treatments to protect against new attacks.
